oec-package

The Observatory of Economic Complexity

### **Description**

Use The Observatory of Economic Complexity's API from R console to obtain international trade data to create spreadsheets (csv format) and D3Plus visualizations.

### **Details**

The functions provided within this package are:

install\_d3plus Installs D3 and D3Plus.

demos Copies the demo file.

getdata Downloads and processes the data from the API for a certain year.

getdata\_interval Experimental function.

network Creates a network for a given year.

treemap Creates a treemap for a given year.

treemap\_interval Experimental function.

The datasets provided within this package are:

countries\_list A list of all the countries in the world and its respective country code.

hs92\_2char HS92 groups. This file is used to create spreadsheets and visualizations with trade data.

hs92\_6char HS92 products (6 characters codes). This file is used to create spreadsheets and visualizations with trade data.

hs92\_8char HS92 products (8 characters codes). This file is used to create spreadsheets and visualizations with trade data.

hs92\_colors HS92 colors. This file is used to create spreadsheets and visualizations based on trade data.

sitc\_rev2\_2char SITC (rev. 2) groups. This file is used to create spreadsheets and visualizations with trade data.

sitc\_rev2\_4char SITC (rev. 2) products (4 characters codes). This file is used to create spreadsheets and visualizations with trade data.

sitc\_rev2\_colors SITC (rev. 2) colors. This file is used to create spreadsheets and visualizations with trade data.

countries\_list 3

countries\_list

A list of all the countries

### **Description**

A list of all the countries in the world and its country code. You need the country code (e.g. chl) to obtain data of a country (e.g Chile)

### Usage

```
countries_list
```

### **Format**

A data frame with 262 observations on the following 2 variables.

```
country the full names of the countries country_code the ids of the countries
```

### **Examples**

```
# see the list of countries
# countries_list
```

demos

Copies the demo file

### Description

Copies the demo file

### Usage

demos()

### Value

Copies a file named  $demo\_examples.R$  to the working directory.

```
# demos()
```

4 getdata\_interval

getdata

Downloads and processes the data from the API

### **Description**

Downloads and processes the data from the API

### Usage

```
getdata(origin, destination, year, classification)
```

### **Arguments**

origin Country code of origin (e.g. "chl" for Chile)

destination Country code of destination (e.g. "chn" for China)

year The OEC's API ranges from 1962 to 2014

classification  $\,$  Trade classification that can be "6" (HS92 6 characters) or "8" (HS92 8 characters) are solved as a classification of the classificati

ters) for the year 1995 and going or "4" (SITC rev.2 4 characters) for the year

1962 and ongoing. The default is set to "6".

### **Examples**

```
# Run countries_list() to display the full list of countries
# Chile is "chl" and China is "chn"

# Download trade data from OEC's API (HS92 6 characters product list)
# for Chile and China in the year 2014
# getdata("chl", "chn", 2014)
# is the same as
# getdata("chl", "chn", 2014, 6)

# Download trade data from OEC's API (HS92 8 characters product list)
# for Chile and China in the year 2014
# getdata("chl", "chn", 2014, 8)

# Download trade data from OEC's API (SITC rev.2 4 characters product list)
# for Chile and China in the year 2014
# getdata("chl", "chn", 2014, 4)
```

getdata\_interval

Downloads and processes the data from the API

### **Description**

Downloads and processes the data from the API

### Usage

```
getdata_interval(origin, destination, initial_year, final_year, classification,
  interval)
```

hs92\_2char 5

#### **Arguments**

origin Country code of origin (e.g. "chl" for Chile)

destination Country code of destination (e.g. "chn" for China)

initial\_year The OEC's API ranges from 1962 to 2014. This needs to be lower than 'final\_year'

final\_year The OEC's API ranges from 1962 to 2014. This needs to be greater than 'initial\_year'

classification Trade classification that can be "6" (HS92 6 characters) or "8" (HS92 8 characters) for the year 1995 and going or "4" (SITC rev.2 4 characters) for the year 1962 and ongoing. The default is set to "6".

interval is an optional parameter to define the distance between years (by default set to

1)

#### **Examples**

```
# Run countries_list() to display the full list of countries
# Chile is "chl" and China is "chn"
# Download trade data from OEC's API (HS92 6 characters product list)
# for Chile and China in the years 2010 to 2014
# getdata_interval("chl", "chn", 2011, 2014)
# is the same as
# getdata_interval("chl", "chn", 2011, 2014, 6, 1)
# Download trade data from OEC's API (HS92 6 characters product list)
# for Chile and China in the years 2010, 2012 and 2014
# getdata_interval("chl", "chn", 2011, 2014, 6, 2)
# Download trade data from OEC's API (HS92 8 characters product list)
# for Chile and China in the years 2010, 2012 and 2014
# getdata_interval("chl", "chn", 2011, 2014, 8, 2)
# Download trade data from OEC's API (SITC rev.2 4 characters product list)
# for Chile and China in the years 2010, 2012 and 2014
# getdata_interval("chl", "chn", 2011, 2014, 4, 2)
```

hs92\_2char

HS92 groups

### **Description**

HS92 groups. This file is used to create the visualizations.

### Usage

hs92\_2char

### **Format**

A data frame with 22 observations on the following 2 variables.

hs92\_group\_name Contains the H292 groups (e.g. animal products, vegetable products, etc) hs92\_group\_id Contains the associated codes of every group (e.g. animal products is 01)

6 hs92\_8char

#### **Examples**

```
# see the group codes for HS92 (6 and 8 characters)
# hs92_2char
```

hs92\_6char

HS92 products (6 characters)

### **Description**

HS92 products (6 characters). This file is used to create the visualizations.

### Usage

hs92\_6char

#### **Format**

A data frame with 1242 observations on the following 4 variables.

hs92\_product\_name Contains the H292 products' names (e.g. horses, bovine, pigs, etc) hs92\_group\_name Contains the H292 groups (e.g. animal products, vegetable products, etc) hs92\_product\_id Contains the associated codes of every product (e.g. horses is 010101)

hs92\_group\_id Contains the associated codes of every group (e.g. animal products is 01)

### **Examples**

```
\# see the group codes and product codes for HS92 (6 characters) \# hs92_6char
```

hs92\_8char

HS92 products (8 characters)

### Description

HS92 products (8 characters). This file is used to create the visualizations.

### Usage

hs92\_8char

#### **Format**

A data frame with 5040 observations on the following 4 variables.

hs92\_product\_name Contains the H292 products' names (e.g. horses, bovine, pigs, etc) hs92\_group\_name Contains the H292 groups (e.g. animal products, vegetable products, etc) hs92\_product\_id Contains the associated codes of every product (e.g. horses is 010101) hs92\_group\_id Contains the associated codes of every group (e.g. animal products is 01)

### **Examples**

```
\# see the group codes and product codes for HS92 (8 characters)
```

# hs92\_8char

hs92\_colors 7

hs92\_colors

HS92 colors

### **Description**

HS92 colors. This file is used to create the visualizations.

### Usage

hs\_colors

#### **Format**

A data frame with 21 observations on the following 2 variables.

hs92\_group\_name Contains the H292 groups (e.g. animal products, vegetable products, etc) hs92\_color Contains the associated colors of every group (e.g. mineral products is #330000)

### **Examples**

```
\mbox{\#} see the group codes and group colors for HS92 (6 and 8 characters) \mbox{\#} hs92_colors
```

install\_d3plus

Installs D3 and D3Plus

### Description

Installs D3 and D3Plus

### Usage

```
install_d3plus()
```

### Value

Copies a folder named d3plus to the working directory and it contains the js files and icons to make the visualizations

```
# install_d3plus()
```

8 network\_interval

network

Creates a network of exports for a given year

### Description

Creates a network of exports for a given year

### Usage

```
network(origin, destination, year, classification)
```

### **Arguments**

origin is the country code of origin (e.g. "chl" for Chile)
destination is the country code of origin (e.g. "chn" for China)
year is the year and the OEC's API ranges from 1962 to 2014

classification refers to the trade classification that can be "6" (HS92 6 characters) or "8" (HS92

8 characters) for the year 1995 and going or "4" (SITC rev.2 4 characters) for

the year 1962 and ongoing

### Value

Creates an HTML file with a network visualization for a given year.

### **Examples**

```
# Run countries_list() to display the full list of countries
# Chile is "chl" and China is "chn"
# Visualize trade data from OEC's API (HS92 6 characters product list)
# for exports from Chile to China in the year 2014
# network("chl", "chn", 2014, 6)
# is the same as
# network("chl", "chn", 2014)
```

network\_interval

Creates a network of exports for a given year

### **Description**

Creates a network of exports for a given year

### Usage

```
network_interval(origin, destination, initial_year, final_year, interval,
  classification)
```

sitc\_rev2\_2char 9

#### **Arguments**

origin is the country code of origin (e.g. "chl" for Chile)

destination is the country code of origin (e.g. "chn" for China)

initial\_year The OEC's API ranges from 1962 to 2014. This needs to be lower than 'final\_year'

final\_year The OEC's API ranges from 1962 to 2014. This needs to be greater than 'initial\_year'

interval is an optional parameter to define the distance between years (by default set to 1)

classification refers to the trade classification that can be "6" (HS92 6 characters) or "8" (HS92

8 characters) for the year 1995 and going or "4" (SITC rev.2 4 characters) for

the year 1962 and ongoing

#### Value

Creates an HTML file with a network visualization for a given year.

### **Examples**

```
# Run countries_list() to display the full list of countries
# Chile is "chl" and China is "chn"
# Visualize trade data from OEC's API (HS92 6 characters product list)
# for exports from Chile to China in the year 2014
# network("chl", "chn", 2014, 6)
# is the same as
# network("chl", "chn", 2014)
```

sitc\_rev2\_2char

SITC (rev. 2) groups

### **Description**

SITC (rev. 2) groups. This file is used to create the visualizations.

### Usage

hs92\_2char

#### Format

A data frame with 36 observations on the following 2 variables.

```
sitc_rev2_group_name Contains the SITC (rev.2) groups (e.g. machinery, electronics, etc) sitc_rev2_group_id Contains the associated codes of every group (e.g. machinery is 10)
```

```
# see the group codes for SITC rev.2 (4 characters)
# sitc_rev2_2char
```

10 sitc\_rev2\_colors

sitc\_rev2\_4char

SITC (rev.2) products (4 characters)

### **Description**

SITC (rev. 2) products (4 characters). This file is used to create the visualizations.

### Usage

```
sitc_rev2_4char
```

#### **Format**

A data frame with 988 observations on the following 5 variables.

sitc\_rev2\_product\_name Contains the SITC rev.2 products' names (e.g. initiating devices, polymerization ion exchangers, etc)

sitc\_rev2\_group\_name Contains the SITC rev.2 groups (e.g. machinery, electronics products,
 etc)

sitc\_rev2\_product\_id Contains the associated codes of every product (e.g. initiating devices is 5722)

sitc\_rev2\_group\_id Contains the associated codes of every group (e.g. machinery is 10)

sitc\_rev2\_product\_code Contains the associated extended codes of every group (e.g. machinery is 105722 that is sitc group + sitc id)

### **Examples**

```
# see the group codes and product codes for SITC rev.2 (4 characters)
# sitc_rev2_4char
```

sitc\_rev2\_colors

SITC (rev. 2) colors

### **Description**

SITC (rev. 2) colors. This file is used to create the visualizations.

### Usage

```
hs_colors
```

### **Format**

A data frame with 36 observations on the following 2 variables.

```
sitc_rev2_group_name Contains the SITC (rev.2) groups (e.g. machinery, electronics, etc) sitc_rev2_color Contains the associated colors of every group (e.g. machinery is #17bcef)
```

```
# see the group codes and group colors for SITC rev.2 (4 characters)
# sitc_rev2_colors
```

treemap 11

t	reemap	Creates a treemap for a given year

### **Description**

Creates a treemap for a given year

### Usage

```
treemap(origin, destination, variable, year, classification, depth)
```

### **Arguments**

origin is the country code of origin (e.g. "chl" for Chile)

destination is the country code of origin (e.g. "chn" for China)

variable is the variable to visualize and it can be "imports", "exports" or "exchange" (trade exchange)

year is the year and the OEC's API ranges from 1962 to 2014

classification refers to the trade classification that can be "6" (HS92 6 characters) or "8" (HS92 8 characters) for the year 1995 and going or "4" (SITC rev.2 4 characters) for the year 1962 and ongoing

is an optional parameter that can take values "0" (group's detail) or "1" (prod-

uct's detail)

### Value

depth

Creates an HTML file with a treemap visualization for a given year.

### **Examples**

```
# Run countries_list() to display the full list of countries
# Chile is "chl" and China is "chn"
# Visualize trade data from OEC's API (HS92 6 characters product list)
# for Chile and China in the year 2014
# treemap("chl", "chn", "exports", 2014, 6)
# is the same as
# treemap("chl", "chn", "exports", 2014)
```

treemap\_interval

Creates a treemap for a given given period of years

### **Description**

Creates a treemap for a given given period of years

### Usage

```
treemap_interval(origin, destination, variable, initial_year, final_year,
  interval, classification, depth)
```

12 treemap\_interval

#### **Arguments**

origin is the country code of origin (e.g. "chl" for Chile) destination is the country code of origin (e.g. "chn" for China)

variable is the variable to visualize and it can be "imports", "exports" or "exchange"

(trade exchange)

initial\_year is the initial year and the OEC's API ranges from 1962 to 2014 final\_year is the final year and the OEC's API ranges from 1962 to 2014

interval is an optional parameter to define the distance between years (by default set to

1)

classification refers to the trade classification that can be "6" (HS92 6 characters) or "8" (HS92

8 characters) for the year 1995 and going or "4" (SITC rev.2 4 characters) for

the year 1962 and ongoing

depth is an optional parameter that can take values "0" (group's detail) or "1" (prod-

uct's detail), by defaults its set to 1

### Value

Creates an HTML file with a treemap visualization for a given period of years.

```
# Run countries_list() to display the full list of countries
# Chile is "chl" and China is "chn"
# Visualize trade data from OEC's API (HS92 6 characters product list)
# for Chile and China in the years 2011 to 2014
# treemap_interval("chl", "chn", "exports", 2011, 2014, 1, 6 ,1)
# is the same as
# treemap_interval("chl", "chn", "exports", 2011, 2014)
```
